Sample Problem and Solution Walkthrough

Problem:

Suppose there are 10 different books, and you want to select 3 to carry on a trip. How many

different selections are possible if:

a) The order of selection does not matter?

b) The books are to be arranged in a specific order?

Solution:

a) Number of combinations (selection without regard to order):

Using the combination formula:

$C(n, k) = n! / (k! (n - k)!)$

Calculate:

$C(10, 3) = 10! / (3! 7!) = (10 \times 9 \times 8) / (3 \times 2 \times 1) = 120$

Answer: 120 different selections.

b) Number of arrangements (permutations):

Since order matters, we use permutation formula:

$P(n, k) = n! / (n - k)!$

Calculate:

$P(10, 3) = 10! / 7! = 10 \times 9 \times 8 = 720$

Answer: 720 different arrangements.

This illustrates how the solutions clarify the approach and reinforce understanding of fundamental counting principles.

Permutations and Combinations

Sample Problem:

How many ways can 5 books be arranged on a shelf if 2 specific books must be together?

Solution Highlights:

The solution treats the two specified books as a single block, reducing the problem to arranging 4 items (the block plus the remaining 3 books). The steps involve:

- Treating the two books as a combined unit.
- Calculating permutations of these 4 units: 4! ways.
- Permuting the two books within the block: 2! ways.
- Multiplying to find total arrangements: 4! × 2! = 24 × 2 = 48.

Educational Value:

The solution demonstrates the use of the "block method," a common combinatorial technique, emphasizing the importance of strategic grouping. It also clarifies why permutations within the block are necessary to account for all arrangements.

Recurrence Relations

Sample Problem:

Solve the recurrence relation $a_n = 3a_{n-1} + 2^{n}$ with initial condition $a_0=2$.

Solution Highlights:

The solution involves:

- Finding the homogeneous solution: $a_n^{(h)} = C \times 3^{n}$.
- Finding a particular solution, often using the method of undetermined coefficients, considering the non-homogeneous part 2^{n}.
- Combining both solutions: $a_n = a_n^{(h)} + a_n^{(p)}$.
- Applying initial conditions to solve for constant C.

Educational Value:

The detailed step-by-step approach demystifies solving recurrence relations, emphasizing the importance of recognizing the form of the non-homogeneous part and choosing the appropriate particular solution.

Generating Functions

Sample Problem:

Find the generating function for the Fibonacci sequence.

Solution Highlights:

The steps include:

- Expressing the Fibonacci sequence recurrence: $F_{n} = F_{n-1} + F_{n-2}$.
- Defining the generating function $G(x) = \sum_{n=0}^{\infty}F_{n}x^{n}$.
- Deriving an algebraic equation for $G(x)$ based on the recurrence relation.
- Solving for $G(x)$: $G(x) = \frac{x}{1 - x - x^{2}}$.
