The Anatomy of a Neuron: A Deep Dive

Understanding a labeled neuron diagram requires familiarity with its core components. Each part plays a critical role in neural communication.

Soma (Cell Body)

The soma, or cell body, is the central hub of the neuron. It contains the nucleus and cytoplasm, overseeing the metabolic activities necessary for neuron survival and function.

Key features:

- Houses the nucleus, which contains genetic material
- Contains organelles like mitochondria, Golgi apparatus, and endoplasmic reticulum
- Integrates incoming signals and generates nerve impulses

Dendrites

Dendrites are tree-like extensions emanating from the soma. They serve as the primary receivers of signals from other neurons.

Characteristics:

- Highly branched to increase surface area
- Receive chemical signals (neurotransmitters) from presynaptic neurons
- Convert chemical signals into electrical signals (graded potentials)

Axon

The axon is a long, slender projection that transmits electrical impulses away from the soma toward other neurons or target tissues.

Features:

- Can vary significantly in length?from micrometers to over a meter
- Encased in a myelin sheath in many neurons, which insulates and speeds up conduction
- Ends in axon terminals that form synapses

Axon Terminals (Synaptic Boutons)

The axon terminals are the endpoints of the axon, where communication occurs with other neurons.

Functions:

- Release neurotransmitters into the synaptic cleft
- Connect with dendrites of postsynaptic neurons
