Step 3: Define Material Properties

Assign realistic material properties to the solid and fluid domains. This includes density, viscosity, elasticity, and damping properties.

Step 4: Set Up Boundary and Initial Conditions

Specify the boundary conditions that reflect the real-world scenario, such as inlet velocities, outlet pressures, and fixed supports.

- For fluid domain: inlet velocity, outlet pressure, walls
- For solid domain: fixed supports, initial deformation
- Initial conditions: initial fluid velocity and pressure, initial structural state

Step 5: Establish the FSI Coupling

ANSYS provides multiple methods for FSI coupling, including the System Coupling module and the Fluent coupling interface. The typical process involves:

- Configuring the structural solver (e.g., Mechanical) for deformation analysis
- Linking both solvers through the FSI coupling interface
- Defining the coupling parameters such as time step size, data exchange frequency, and convergence criteria

Step 6: Run the Simulation

Execute the coupled FSI analysis, monitoring key parameters like residuals, deformation, and flow rates. Be prepared to adjust time steps or solver settings if convergence issues arise.

Step 7: Post-Processing and Results Analysis

After simulation completion, analyze the results to gain insights into the fluid and structural behaviors:

- Visualize flow patterns, pressure distributions, and velocity fields
- Examine deformation, stress, and strain in the solid structure
