- Current Measurement: Current transformers (CTs) or shunt resistors are employed to sense the current flowing through the load.

These sensors produce analog signals proportional to the actual line voltage and current.

Step 2: Signal Conditioning

The raw analog signals from sensors are typically weak or may contain noise. Therefore, they undergo:

- Filtering to remove high-frequency noise.
- Amplification to match the input range of the ADC.
- Isolation to ensure safety and prevent interference.

This stage ensures the signals are clean and suitable for accurate digitization.

Step 3: Analog-to-Digital Conversion

Once conditioned, the analog signals are fed into the ADC:
